

WHAT IS BROMELAIN?

BROMELAIN is a proteolytic enzyme — an enzyme which breaks down protein — that is found naturally in the stems of pineapples.

Inside our bodies, many unhealthy cells “disguise” themselves from the immune system using a **protective protein shield**.

Proteolytic enzymes like **bromelain** can help identify and promote the removal of unhealthy cells.

Bromelain also contains components that interfere with the growth of tumor cells and other unhealthy cells; therefore, it may help the body **HEAL** and **RECOVER** normally.

FACT:

Glioma tumor cells were studied and displayed reduced adhesive, migratory and invasive properties following bromelain treatment. Results showed a **43% difference in tumor migration in brain tissue** between the bromelain-treated group compared to the control group.¹

Bromelain helps the body to produce enzymes that **SUPPORT** normal healing.

FACT:

Bromelain has been studied for its ability to enhance the effect of antibiotics. In a study of people with urinary tract infections, **100% of participants given antibiotics in combination with bromelain were cured of their infection**, compared to just 46% who received antibiotics alone.²
